JAVA PROGRAMMING ASSIGNMENT 07

Problem 1: Find the Largest Element in an Array

Description:

Write a Java program that prompts the user to input the size of an array and then the elements of the array. The program should then find and print the largest element in the array.

Concepts Covered:

- Array creation and initialization
- Accessing elements of an array
- Looping through an array using a traditional `for` loop

Hint:

- Use a `for` loop to iterate through the array, comparing each element to find the largest one.

Problem 2: Reverse an Array

Description:

Write a Java program that takes an array of integers from the user and prints the array in reverse order.

Concepts Covered:

- Accessing and modifying array elements
- Looping through an array
- Array indexing

Hint:

- Use a `for` loop to swap elements from the beginning and the end of the array, working towards the center.

Problem 3: Calculate the Average of Array Elements Using For-Each

Description:

Write a Java program that prompts the user to input an array of integers and then calculates and prints the average of all elements in the array using a `for-each` loop.

Concepts Covered:

- Looping through an array with `for-each`

- Accessing array elements
- Array length

Hint:

- Use a `for-each` loop to sum all the elements and then divide by the array's length to find the average. Use the `length` property of the array to get the number of elements.
